

DUPLICATED CASSAVA VEIN MOSAIC VIRUS

ENHANCERS AND USES THEREOF

Abstract of the Invention

The invention features duplicated enhancer domains and enhancer  
5 cassettes. The invention also features expression constructs having one or more  
duplicated enhancer domains and a promoter under the regulation of the duplicated  
enhancer domains. The expression construct is useful for increasing the  
expression of any nucleic acid molecule that is operably linked to the expression  
construct. Accordingly, the invention also features a method for expressing a  
10 nucleic acid molecule through the use of an expression construct of the present  
invention.
